

# Similar Doctors

## Problem Statement

A site contains a listing of doctors. Users can browse for doctors given a specific specialty, area, review score etc.

Write a simple web application which allows you to browse a list of doctors. When a doctor is selected, display their details, along with a list of similar doctors, in a prioritized order. You define what similar means and the result ordering, but clearly document any assumptions in your code. You can assume the entire directory of doctors fits into memory.

Publish the web app on a public URL e.g. Heroku or Amazon S3 and submit the link along with the code.

Aim to spend a maximum of 1.5hrs on this exercise. If applicable, note down any remaining thoughts or things you would want to improve on with more time.
